

THE FUTURE OF CYBER IS PREEMPTIVE DEFENSE

If detection-based security worked, the world wouldn't have a \$10-trillion-a-year cybercrime problem.

"Ignoring the shift brought by AI driven cyberthreats poses a significant and escalating risk... by clinging to reactive strategies, leaders expose their organizations to unprecedented danger."

Gartner®, September 2025

Even today's best AI-enabled firewalls still have to detect an attack—multiple times—before they learn to counter it. By then, it's too late. Using their own AI tools, the hackers are already exfiltrating data, planting payloads, and covering their tracks.

Can you mitigate that risk? Maybe. But why mitigate the risk, when you can *eliminate it—Preemptively*

**WITH CYBERSLICE® BY CYEMPTIVE, THE FUTURE IS NOW
Preempt First. Detect later. Operate continuously.**

Our battle-tested CyberSlice® technology breaks the cyberattack kill-chain.

It doesn't need to detect. Or learn. Or predict.

It preempts—autonomously, continuously, and invisibly—defeating the hacker's strategy before the first attack even plays out.

In stealth development for almost a decade before its first public offering, CyberSlice® is the ultimate enforcer of End-to-End Zero Trust.

Worried about compromised credentials? Unknown Zero Day exploits? Supply chain hacks? CyberSlice® defeats them all and returns your system to a safe state in seconds to minutes. That's the power of **Preemptive Defense**. That's **Cyemptive**.

"I'm really excited for the preemptive security model that Cyemptive has come up with that is going to revolutionize what happens with security today."

-Jim DuBois, Former Microsoft CIO
